Backend engineer with 4+ years designing, building, and owning production systems using Java and Spring Boot, from requirements and design through deployment and production support. Built scalable microservices and event-driven systems with Kafka, SQL, and Kubernetes, including a 60M+ document platform, modernization of a decade-old production platform, and AI-enabled backend workflows. Own features end-to-end and work directly with product, operations, and technical stakeholders to turn business requirements into production systems.

Work Experience

JPMorgan Chase & Co

Mumbai, India

Software Engineer II

January 2026 — Present

- Own the **design and development of the backend functionality**, working directly with operations users, product BA, and technical BA to gather, refine, and finalize requirements, then translating them into production workflows.
- Owned a **Spring Boot data-extraction service** feeding an AI model-training pipeline, parallelized parameterized SQL workloads across date ranges, products, and transaction types, reducing monthly processing from **2.5h to 1.5h (40%)** and 12-month backfills from **30h to 18h (40%)**.
- Designed and built a PDF evidence-generation system**, processing 8 sections concurrently and merging them in **<2s**, implemented fail-fast transaction gating so submission is blocked when evidence generation fails.
- Owned the **development of a new validation feature in a 142-module Spring monolith**, enforcing mandatory requirements across 21 products and blocking transaction submission when required documents are missing, became the validation point of contact for the project and later carried the feature into the next-generation platform.
- Led modernization of a 10+ year-old KYC platform**, migrating 7 modules from **Spring Framework/Linux to Spring Boot/Kubernetes** and executing phased cutover alongside the legacy system with component-level traffic routing and instant rollback, resulting in zero production regressions or rollbacks.

ISS STOXX (formerly Institutional Shareholder Services)

Mumbai, India

Associate Software Engineer

January 2025 — January 2026

- Owned the design and development** of CMAS's Java services, a distributed document-processing platform with Kafka-connected processing stages and CRUD/search APIs, **processing 60M+ documents**.
- Led the **zero-downtime migration of 7 Kubernetes clusters** across 3 major projects over one week, coordinating DevOps, network, and storage teams across resource sizing, host whitelisting, volume mounts, workload migration, validation, and project-owner sign-off.
- Sole engineer responsible for the UI modernization**, designing and developing a **50+ component React framework** over 5+ months to replace 5 legacy Angular applications, established the architecture and handed it over to 3 engineers through structured knowledge transfer.

Analyst

January 2023 — December 2024

- Led the redesign of CMAS's ingestion pipeline**, replacing untyped end-to-end payloads with a typed Java document hierarchy and stage-specific models, improving data ownership across Java, Node.js, and Python processing stages.
- Drove CMAS's **storage architecture redesign**, replacing Elasticsearch as the system of record with **MSSQL for structured data, S3 for source documents, and Elasticsearch** for search, redesigned indexing so the search layer could be rebuilt from source and rebuilt all Java services against the new model.
- Designed and owned a **Trie-based blocked-URL filtering** service replacing full-blocklist URL comparisons, deployed across **5 production projects and processed 20M+ URLs**.
- Built and owned an **asynchronous failed-document reprocessing pipeline** using **Kafka, Python, and MongoDB**, with duplicate handling, audit tracking, and automated reporting, reducing manual intervention in document recovery.
- Owned **releases to Production**, coordinating release documentation, tagging, configuration, and cross-team rollout, also served as a stakeholder-facing point of contact for users and business teams across regions

Intern → Junior Analyst

January 2022 — December 2022

- Built **Spring Boot REST APIs** backed by MongoDB and Elasticsearch, reducing API latency by 45% under high load, and established Docker, Kubernetes, Jenkins, and GitLab CI/CD for application deployment.
- Built responsive React.js UI components integrated with backend APIs, contributing reusable components adopted across 10+ application screens.

Skills

Languages: Java 21, Python, TypeScript

Backend: Spring Boot, Microservices, REST API design, Distributed Systems, Event-Driven Architecture, Concurrency and Multithreading.

Messaging & Data: Apache Kafka, Redis, MongoDB, MSSQL, SQL, Elasticsearch, S3/MinIO

Infrastructure & DevOps: Kubernetes (K8s), Docker, Jenkins, GitLab CI/CD (Continuous Integration/Continuous Delivery), Linux, Secrets Management

Tools: Git, Jira, Confluence, IntelliJ IDEA, GitHub Copilot

Projects

Expense Tracker

React 19, TypeScript, Firebase, Gemini AI • [\[GitHub\]](#) • [\[Live\]](#)

- Built an **AI-powered financial query system using RAG**, generating vector embeddings for transactions on insertion and retrieving relevant financial context for **natural-language spending queries**.
- Designed a **cost-efficient dual-collection Firestore data model**, maintaining **pre-aggregated monthly summaries** to trade higher write complexity for constant-time dashboard reads.
- Built an **offline-first PWA** with local caching and background synchronization, maintaining application usability during network interruptions and synchronizing state after reconnection.

Education

Vivekanand Education Society's Institute of Technology

August 2019 — June 2022

Master of Computer Application (CGPA: 9.47/10.0)

Mumbai, India
