Backend Software Engineer with 4+ years designing, building, and owning production systems using Java and Spring Boot, from requirements and design through deployment and production support. Built scalable microservices and event-driven systems with Kafka, SQL, and Kubernetes, including a 60M+ document platform, modernization of a decade-old production platform, and greenfield AI-enabled backend systems.

Work Experience

Software Engineer II | January 2026 - Present

JPMorgan Chase | Mumbai, India

- **Led modernization of a 10+ year-old KYC platform**, migrating 7 modules from **Spring Framework/Linux to Spring Boot/Kubernetes** and executing phased cutover alongside the legacy system with component-level traffic routing and instant rollback, resulting in zero production regressions.
- Accelerated AI product iterations by **engineering a Spring Boot data-extraction service** parallelized production SQL queries to extract training data, reducing 12-month backfill runtimes by **40% (from 30h to 18h)**.
- Designed and built a concurrent PDF evidence-generation system (merging **8 sections in <2s**) with fail-fast transaction gating, preventing cross-system data inconsistencies and eliminating downstream transaction failures in dependent platforms.
- Spearheaded the **development of a new validation feature** in a **142-module Spring monolith**, enforcing mandatory requirements across 21 products and blocking transaction submission, eliminating orphaned transactions and preventing end-users from encountering unresolvable missing-file errors.
- Directed end-to-end **design and development of the backend functionality**, working directly with operations users, product BA, and technical BA to gather, refine, and finalize requirements, then translating them into production workflows.

Associate (Software Engineer) | January 2025 - January 2026

ISS STOXX | Mumbai, India

- Architected and developed an enterprise **distributed document-processing platform** with Kafka-connected pipelines and CRUD/search APIs, **processing 60M+ documents** to enable highly available data retrieval for global analysts.
- Led the **zero-downtime migration of 7 Kubernetes clusters** across 3 major projects over one week, coordinating DevOps, network, and storage teams across resource sizing, host whitelisting, volume mounts, workload migration, validation, and project-owner sign-off.
- **Sole engineer responsible for the UI modernization**, designing and developing a **50+ component React framework** over 5+ months to replace 5 legacy Angular applications, established the architecture and handed it over to 3 engineers through structured knowledge transfer.

Analyst | January 2023 - December 2024

ISS STOXX | Mumbai, India

- **Led the redesign of Core Document Ingestion Pipeline**, replacing untyped end-to-end payloads with a typed Java document hierarchy and stage-specific models, improving data ownership across Java, Node.js, and Python processing stages.
- Drove **storage architecture redesign**, replacing Elasticsearch as the system of record with **MSSQL for structured data, S3 for source documents, and Elasticsearch** for search, redesigned indexing so the search layer could be rebuilt from source and rebuilt all Java services against the new model.
- Designed a **Trie-based blocked-URL filtering** service replacing full-blocklist URL comparisons, deployed across **5 production projects and processed 20M+ URLs**.
- Built and governed an **asynchronous failed-document reprocessing pipeline** using **Kafka, Python, and MongoDB**, with duplicate handling, audit tracking, and automated reporting, reducing manual intervention and improving the platform's overall data ingestion success rate.
- Orchestrated **releases to Production**, coordinating release documentation, tagging, configuration, and cross-team rollout, also served as a stakeholder-facing point of contact for users and business teams across regions.

Junior Analyst (Promoted from Intern) | January 2022 - December 2022

ISS STOXX | Mumbai, India

- Built **Spring Boot REST APIs** backed by MongoDB and Elasticsearch, reducing API latency by 45% under high load, and established Docker, Kubernetes, Jenkins pipelines for application deployment.
- Built responsive React.js UI components integrated with backend APIs, contributing reusable components adopted across 10+ application screens.

Skills

Languages: Java 21, Python, TypeScript

Backend: Spring Boot, Microservices, REST API design, Distributed Systems, Event-Driven Architecture, Concurrency and Multithreading.

Messaging & Data: Apache Kafka, Redis, MongoDB, MSSQL, SQL, Elasticsearch, S3/MinIO

Infrastructure & DevOps: Kubernetes (K8s), Docker, Jenkins, GitLab CI/CD (Continuous Integration/Continuous Delivery), Linux, Secrets Management

Tools: Git, Jira, Confluence, IntelliJ IDEA, GitHub Copilot

Projects

Expense Tracker

NoSQL Data Modeling, RAG Architecture, Gemini AI | [\[GitHub\]](#) | [\[Live\]](#)

- Designed a **cost-efficient dual-collection Firestore data model**, maintaining **pre-aggregated monthly summaries** to trade higher write complexity for constant-time dashboard reads.
- Built an **AI-powered financial query system using RAG**, generating vector embeddings for transactions on insertion and retrieving relevant financial context for **natural-language spending queries**.

Education

Master of Computer Application | CGPA: 9.47/10.0 | August 2019 - June 2022

Vivekanand Education Society's Institute of Technology | Mumbai, India
