Software Engineer with 4+ years of experience building and owning distributed systems using Java, Spring Boot, and Microservices. Designed and scaled a high-throughput document processing platform handling 60M+ documents. Currently at JPMorgan Chase leading a KYC system modernisation. Seeking backend engineering roles in Europe with visa sponsorship.

Skills

Languages: Java 21, Python 3.9+, TypeScript, JavaScript

Frameworks & Libraries: Spring Boot, Spring MVC, Spring Framework, Microservices, REST APIs, Node.js, React.js

Messaging & Streaming: Apache Kafka

Data: MongoDB, Redis, Elasticsearch

CI/CD: Kubernetes (K8s), Docker, Jenkins, GitLab CI/CD, Linux

Tools: Git, Jira, Confluence, Eclipse, VSCode

Work Experience

JPMorgan Chase & Co

Mumbai, India

Software Engineer II

January 2026 — Present

- Built a Spring Boot data extraction service with parallelized SQL query execution, cutting historical transaction data processing time per month from 2.5 hours to 1.5 hours across 12 months of data prepared for AI model training.
- Implemented validation logic across 21 product and transaction-type scenarios in a 142-module Spring monolith, introducing a shared validation service reused across all scenario variants.
- Designed server-side PDF generation for 8 transaction assessment modules (risk flagging, vessel/container tracking, bill of lading, screening) using Thymeleaf and PDFBox, adding 25+ new classes to support compliance evidence documentation.
- Led end-to-end modernisation of a 10+ year-old KYC compliance module, from system analysis through deployment. Migrating from Spring Framework to Spring Boot with zero regression in business-critical workflows.
- Designed and implemented a CI/CD pipeline using Jenkins and Kubernetes to enable repeatable, automated deployments and significantly reduce manual release effort.

ISS STOXX (Institutional Shareholder Services)

Mumbai, India

Associate Software Engineer

January 2025 — January 2026

- Designed and built 5+ Java microservices forming the core of a distributed document processing platform (CMAS), handling ingestion, transformation, and indexing of 60M+ documents. Rewrote a shared Java database access library adopted by 10+ internal projects, improving query performance consistency.
- Led the migration and scaling of 4 production Kubernetes clusters, working across DevOps, network, and storage teams to provision resources, configure volume mounts, and safely migrate workloads with zero downtime.
- Led a major UI modernization effort, building a reusable React component framework (50+ components) that replaced 4 Angular applications, cutting new feature development time by 40%.

Analyst

January 2023 — December 2024

- Led the end-to-end migration of CMAS from DocumentDB to SQL, redesigning data models and service layers using OOP principles (improving throughput by 45%, cutting processing time from 15s to under 10s), while contributing to architecture decisions on caching (Redis) and inter-service communication patterns.
- Built an end-to-end document reprocessing pipeline (Python + Kafka) to handle failed uploads, including deduplication, audit DB integration (MongoDB), async tracking, and automated reporting, significantly reducing manual intervention.
- Designed and implemented a custom Trie-based URL filtering system to efficiently match blocked URLs at scale, now used across 5+ projects and processing 20M+ URLs in production.
- Owned production releases end-to-end, including deployment planning, release documentation (Confluence), config management, and cross-functional rollout coordination.

Junior Analyst

July 2022 — December 2022

- Developed Spring Boot REST APIs with MongoDB and Elasticsearch, reducing API latency by 45% (40s to 22s) under high-load scenarios; introduced Docker containerization and Kubernetes deployments, and helped set up CI/CD pipelines (Jenkins, GitLab), reducing release cycles by 30%.

Intern

January 2022 — June 2022

- Built responsive React.js UI components integrated with backend APIs, contributing reusable components adopted across 10+ application screens.

Projects

Expense Tracker

React 19, TypeScript, Firebase, Gemini AI [GitHub] [Live]

- Designed a personal finance system with real-time updates and offline-first architecture, ensuring consistent user experience under low connectivity. Integrated AI-based analysis for summarizing spending patterns, improving usability and insights for end users.
- Modeled data using a dual-collection Firestore design to maintain atomic updates between transactions and aggregated monthly summaries, eliminating full dataset scans on read.

Education

Vivekanand Education Society's Institute of Technology

August 2019 — June 2022

Master of Computer Application (CGPA: 9.47/10.0)

Mumbai, India

Certificates

Hacker Rank: Problem Solving

Stanford University: Algorithms Specialization

Microsoft: Azure Fundamentals AZ-900
