Backend Engineer with 4+ years building Java and Spring Boot services on Kubernetes at JPMorgan Chase and ISS STOXX. Built a Kafka-based distributed document platform handling 60M+ documents, led a phased migration of a 10-year-old KYC platform to Spring Boot and Kubernetes with zero production regressions, and own production releases and troubleshooting.

Work Experience

Software Engineer II | January 2026 - Present

JPMorgan Chase | Mumbai, India

- **Led migration of a 10-year-old KYC platform** (7 modules) from Spring Framework on Linux to **Spring Boot on Kubernetes**. Ran old and new components side by side, then switched traffic per component with instant rollback available, resulting in zero production regressions.
- Engineered a multithreaded Spring Boot extraction service that runs **5 join-heavy SQL queries in parallel** and uploads one archive per transaction to **S3**, covering **242K records across 21 products** and cutting backfill time by **40% (30h to 18h)**.
- Built a **concurrent document-generation service** that renders 8 sections in parallel and merges them into **8-20 page PDFs in under 2 seconds**. Blocks transaction submission if generation fails, preventing cross-system data inconsistencies.
- Spearheaded development of a new **validation feature in a 142-module Spring monolith**, enforcing mandatory requirements across 21 products and blocking transaction submission, eliminating orphaned transactions and preventing unresolvable user errors.
- **Resolved production defect** where the validation fired on non-eligible products. Traced the call path through **Splunk logs** to an early-return on null data in legacy code, removed it, and deployed the fix in under 12 hours.
- Partnered directly with **operations users and product/technical BAs to refine requirements**, design backend solutions, and translate business workflows into production functionality.

Associate (Software Engineer) | January 2025 - January 2026

ISS STOXX | Mumbai, India

- **Built Java services and Kafka-based processes** for a distributed document-processing platform that ingests, converts, and indexes files and URLs for global analysts, **processing 60M+ documents**.
- **Led zero-downtime migrations of 7 Kubernetes clusters** across 3 distributed projects over one week, coordinating DevOps and network teams for resource sizing, volume mounts, and workload validation.
- **Wrote 70+ Karate API test scenarios in Gherkin-style syntax**, covering positive and negative cases across 10+ endpoints, and ran them in parallel before each release.
- Built an asynchronous, **fault-tolerant error-reprocessing pipeline using Kafka and MongoDB**, featuring automated audit tracking and duplicate handling to improve data ingestion success rates.
- Designed and built a **50+ component React framework over 5+ months**, replacing 5 legacy Angular applications, and successfully handed it over to engineering peers through structured knowledge transfer.

Analyst (Software Engineer) | January 2023 - December 2024

ISS STOXX | Mumbai, India

- **Led the redesign of the Core Document Ingestion Pipeline**, replacing untyped payloads with a typed Java document hierarchy and stage-specific models to streamline data ownership across multi-language processing stages.
- Drove **storage architecture redesign**: moved the system of record from Elasticsearch to **MSSQL (structured data) and S3 (source documents)**, keeping **Elasticsearch for search** only. Redesigned indexing so the search layer can be rebuilt from source, and rebuilt all Java services against the new model.
- Designed a **Trie-based filter that matches URLs against a blocklist by domain prefix**, deployed across **5 production projects and processing 20M+ URLs**.
- **Orchestrated production releases**, managing deployment documentation, tagging, configuration, and cross-team rollout, while **troubleshooting application logs using Graylog and Kubernetes pod failures** and serving as a stakeholder-facing technical point of contact.

Junior Analyst (Software Engineer) (Promoted from Intern) | January 2022 - December 2022

ISS STOXX | Mumbai, India

- Built **Spring Boot REST APIs** backed by MongoDB and Elasticsearch, reducing API latency by 45% under high load, and set up Docker, Kubernetes and Jenkins pipelines for application deployment.
- Built responsive React.js UI components integrated with backend APIs, contributing reusable components adopted across 10+ application screens.

Skills

Languages: Java 21, Python, TypeScript

Backend: Spring Boot, Microservices, REST API design, Event-Driven Architecture, Concurrency and Multithreading

Messaging & Data: Apache Kafka, Redis, MongoDB, MSSQL, SQL, Elasticsearch, S3 (MinIO)

Testing & Debugging: Karate, Gherkin (BDD), Splunk, Graylog

Infrastructure & DevOps: Kubernetes (K8s), Docker, Jenkins, CI/CD (Continuous Integration/Continuous Delivery), Linux

Tools: Git, Jira, Confluence, IntelliJ IDEA, GitHub Copilot, Claude Code.

Projects

Expense Tracker

NoSQL Data Modeling, RAG Architecture, Gemini AI | [GitHub](#) | [Live](#)

- Designed a **cost-efficient dual-collection Firestore data model** with pre-aggregated monthly summaries, **trading higher write complexity for constant-time dashboard reads**.
- Built an **AI-powered financial query system using RAG**, generating vector embeddings for transactions on insertion and retrieving relevant contextual data for **natural-language spending queries**.

Education

Master of Computer Application | CGPA: 9.47/10.0 | August 2019 - June 2022

Vivekanand Education Society's Institute of Technology | Mumbai, India
